

CLAWE UI — Proposed delivery order

Draft v5 · September 30, 2026 · for review. Mockups are illustrations of what each step would add, not built screens.

What changes: the first build that shows a **radar running** moves from iteration 11 (week 22) to **iteration 7 (week 14)**, eight weeks sooner. It runs on a **simulated radar** behind an interface that real HOCA / hardware replaces later (iteration 11). Nothing is dropped. The total stays 12 iterations (about 24 weeks). The waveform summary, live preview and browser move later, since the editor already works.

Overview

Iteration	Weeks	What you get	New screens	Mockup
1–4 	1–8	Radar, mode and waveform editors; connection to STS over interface B (proxy + RabbitMQ)	Built	
5	9–10	Waveform calculation engine: CPI duration, processing gain, eclipsing, range/velocity ambiguity	None (behind the scenes)	
6	11–12	Simulated radar + Execution View Control tab, Play/Stop, Auto schedule, target table, “Run this mode” button	New	Mockup 6
7	13–14	Graph windows + 2D RDI scope. First build you can demo to buyers.	New	Mockup 7
8	15–16	Waveform summary screen with trade-offs; waveform editor layout rework	New / reworked	Mockup 8
9	17–18	Live signal preview in the waveform editor	New	Mockup 9
10	19–20	Waveform browser and filters (thousands of waveforms)	New	Mockup 10
11	21–22	Real HOCA / hardware connection (interface C); the simulator stays for demos	Almost none (a “Simulated / HOCA” badge)	—
12	23–24	Cognitive mode (with a simulated jammer), 3D scope, hardening, installer	New	Mockup 12

Weeks count from the start of the project. Iterations 1–4 are finished.

Before and after

	Previous order	Proposed order
First running radar with a scope	Iteration 11 (week 22)	Iteration 7 (week 14)
Waveform summary screen	Iteration 6 (week 12)	Iteration 8 (week 16)
Live signal preview	Iteration 7 (week 14)	Iteration 9 (week 18)
Real HOCA / hardware	Iteration 9 and 12	Iteration 11 (second to last)
Total length	12 iterations	12 iterations

Decisions needed

1. **Order.** Is it acceptable that the summary screen and live preview arrive after the running-radar demo?
2. **Closed-loop story.** The strongest thing to show buyers may be the cognitive mode adapting to a simulated jammer (iteration 12 above). Should it move to follow iteration 7?
3. **Simulated data.** The demo shows simulated targets, clutter and jamming, labelled as simulated. Is that acceptable for buyer demos, and how realistic does it need to look?
4. **Waveform editing during a run.** The first demo only selects among existing waveforms. Do buyers need to edit waveforms while the radar runs?

Mockups

Iteration 6 — Simulated radar + Execution Control tab

Open a mode in the editor, click Run, pick a waveform, press Play. Targets appear in the table. Everything is labelled as simulated.

Iteration 7 — Graph windows + 2D RDI scope (the buyer-demo milestone)

The first build that shows a radar running: a live range-Doppler scope and target table in resizable, removable windows. A 3D scope placeholder holds its place.

Iteration 8 — Waveform summary + editor layout rework

A plain-language description, the five calculations, the eclipsing chart, and “What if...” trade-offs while you edit. Waveforms get their own workspace, so the mode's tabs are less crowded.

Iteration 9 — Live signal preview

Pulse detail, a PRI histogram and a spectrogram redraw as you change a field. The exact set of views is still to be decided, because 1,024 pulses can't be drawn one by one.

Iteration 10 — Waveform browser and filters

CLAWE Controller

Radar editor

MOCKUP - ITERATION 10 - NOT BUILT YET

AN/APQ-Demo

TTR Track

Waveform browser

Also available in the Execution view's Control tab, to pick a waveform to play.

Scrolls through thousands of rows without slowing down; filters run on stored summary values, not by opening each waveform.

Iteration 10 — Waveform browser + filters.

Find a waveform among thousands by name, parameter ranges, calculated metrics and modulation type.

Illustrative

Find a waveform among thousands by name, parameter ranges, calculated metrics and modulation type.

Iteration 12 — Cognitive mode (proposed panels)

The radar tries waveforms against jamming and adapts. Shown with a simulated jammer, so the closed-loop story can be demonstrated without hardware.

Iteration 5 (calculation engine) and iteration 11 (hardware connection) add no new screens of their own.
